

ABSTRACT OF THE DISCLOSURE

A napkin dispenser has a body and a stand that supports the dispenser on a horizontal surface. The body has two main sections, a first upstream section that is
5 straight and extends over the majority of the length of said body, and a second downstream section that extends at an angle relative to the first section and communicates with a dispensing opening. When the dispenser is supported by the stand on a horizontal
10 surface, each of the first and second sections forms an oblique angle relative to the horizontal surface, with the first section forming an angle that is more nearly vertical, and the second section forming an angle that is more nearly horizontal.
